English Premier League Database Management System

Java Swing | MySQL | JDBC | SQL Reports

What the system does

This desktop application manages league data for clubs, players, fixtures, transfers, standings, and reports. It is designed for a DBMS class project that requires a complete schema, a Swing interface, and meaningful SQL output.

Key project features

- CRUD screens for clubs, players, fixtures, and transfers
- MySQL schema with keys, constraints, sample data, and views
- League reports for standings, top scorers, fixtures, and transfers
- Presentation-ready screenshots and documentation
